

Secrets To More Better Sound

Reprinted with permission from the *Earschplittenloudenboomer Audio Group*

Building loudspeaker enclosures with better internal damping materials will result in much more better sound. Kind of goes without saying.

Our loudspeaker enclosures are lined with a very rare and unique material. Flea feces. And not just any flea feces. Our pampered fleas can trace their lineage back to the “Extraordinary Exhibition of Industrious Fleas” on Regent Street, London, during the 1820’s. They were represented by none other than the Italian impresario Louis Bertolotto. These noble critters have a very honorable heritage indeed!

This unique and special feces is blended with shaved Royal Blue Ice sourced from ancient icebergs found off the coast of Jökulsárlón, Iceland. We harvest this ice on February 29th, which can only occur during a leap year.

This proprietary poop, which now has the consistency of tapioca pudding, is cured for 3.14159 years, or days, whichever we can manage. It is then cryogenically treated in Mom’s Frigidaire, until Mom starts yelling to get that damn s**t out of her damn refrigerator!

What is now a putrid pancake is then re-hydrated using the melted and dreaded yellow snow found in the frozen tundra behind the parking lot of Saint Alfonzo’s Pancake Heaven. This slurry is brought to a slow simmer in Mom’s favorite Dutch oven until Mom starts to, well, you get the idea. This special sauce is then meticulously applied to the insides of the enclosure using a super special secret process. Even we aren’t sure how it’s done.

The result? It sounds more better. And as we all know, more is always better.

Of course this is all sarcastic babble, but you knew that, right? There’s no way we could wait 4 years to harvest Royal Blue Ice. That would just be silly.

HAPPY LISTENING

John
